APPLICATION SERVICE PROVIDER (ASP) ARCHITECTURE FOR
PROPERTY MANAGEMENT AND CALL ACCOUNTING

5

ABSTRACT OF THE DISCLOSURE

A system and method for centralizing property management and/or call accounting services for a hotel through a network-based service provider. This architecture allows hotels to

10 migrate from existing premise-based systems for PMS and Call Accounting to a centralized system without the need for replacing the existing PBX system at each hotel premise. An internetwork for providing property management services includes a client network and a service provider network. The client network

15 transmits to the service provider network a call parameter for a completed call. The service provider network preferably determines a cost for the completed call based on the call parameter and transmits the call cost information back to the

20 client network to charge the cost to an account.
